

The Dynamic Phase of Technology

Technology becomes the wings that will allow the educational world to fly - Jenny Arledge

In our lives education plays a vital role and it is important to build a better society. Technology on the other hand is important to improve ourselves in the fast- moving world.

Technology and education go hand in hand. Technology is improvising education. But fact is that technology has both boon and curse. Platform like YouTube classes lectures, quiz apps, Chat GPT etc... help children learn and improvise their educational standards. The disadvantage is the distractions caused by gadgets.

Technology gets it's real worth only when it's paired with the essence of knowledge. With the growth of technology, the platform for education has also increased.

Nowadays, education without digitalization is hard, we also have many core subjects related to technology and keeping all these factors in mind, we can say that both of these are important.

Both of these play a very vital role in forming a better society and world. Technology can provide students with many ways to excel in their studies by providing various effective platforms.

These improvements in the areas of technology help us gain a lot in either education or the real world.

In conclusion, technology without education has no use and education without technology is not (effective, technology and education is a very bright and effective combination) that lightens many lives if used in right manner.
