

Education treading the path of technology - with caution

Children have been “mining” google answer for decades. Essay writings, homeworks, projects are some main things school. Children ask google for but how did the study in the past? That’s a question for us children to answer. Now with Elon Musk “ inventing” ChatGPT, Children are basically CTRL+C and CTRL+V in everything, whether it’s homework or schoolwork. But we children probably wouldn’t understand the “Darkside” of ChatGPT.

Technology was our messiah during the covid-19 pandemic. Online classes were the only way we could get knowledge without going to school. That is technology helping education.

Larry page, Google’s co-funder had created google, keeping in mind that Google should provide the best and important results on the web. But with kids today, their “important” results are just maths equation answers or science diagrams or so on. How did people in the past get correct answers? That’s another question for us to think about.

We children have many technological resources to help us in almost anything. But we children use these technological resources only to “get the job done.” This causes a major problem, creativity! It ruins our creativity. Technology may take our jobs, occupation, etc. but our creativity is what makes us special. Without it we are nothing.

Technology can be a guide for education, not a saviour.
